

CAPABILITY DOCUMENT

We make good businesses run better

We replace the spreadsheets and SaaS sprawl your
business runs on with one intelligent platform - built in
weeks, not years.

15+ SAAS PLATFORMS CONNECTED · IN PRODUCTION THREE WEEKS AFTER FIRST COMMIT · 24/7, HANDS-FREE

What we build

For businesses that are already making money - and losing time. Come with a blank page or a half-finished process map - we run the whole transformation end to end, or plug in as the build engine behind your internal change lead.

- | | | |
|----|----------------------------|---|
| 01 | Process automation | We find where work actually stalls - quotes, job management, approvals, handoffs - and remove the manual steps. What your team used to do by hand now happens in seconds, automatically. |
| 02 | Systems integration | CRM, quoting, accounting, inventory - one pipeline, one source of truth, on your stack: Microsoft, Google, AWS. |
| 03 | SaaS replacement | Custom platforms that replace the subscriptions you've outgrown. Owned outright, no seat fees - built to replace the enterprise CRM you use a fraction of. |
| 04 | AI-native software | Intelligence designed in from the start - validating data, drafting the routine work, answering the questions your team used to dig for. |
| 05 | Company-native AI | A private AI workspace on your own data - every prompt logged, governed, owned by you. We've shipped this: a governed workspace where leadership asks in plain English and gets live dashboards back. |

The product changes. The spine doesn't. The same pipeline runs utility-scale engineering and the local service round - sales in, jobs scheduled, work delivered, invoices out - and every build starts from the one your business already runs on.

The build documents itself

One process from first meeting to live platform. No status decks - you watch it happen inside the product.

01 Map

Stakeholder sessions, process mapped end-to-end - or we build straight from the map your team already owns.

02 Build

Your platform takes shape module by module. Humans stay in the loop.

03 Track

No status decks. The platform is the project tracker - watch progress inside the tool you're buying.

04 Run

The tracker becomes the operating system. SaaS subscriptions retire behind it.

How we work

01 Ship real code

Production code with modern frameworks. Working software shows up early in the engagement - not at the end.

02 Start from how the business works

We can map the process end to end - or build straight from the map your transformation team already owns. The system design follows the process either way.

03 AI-native thinking

Intelligence at the core, not bolted on - validating data before it propagates, drafting the routine work, answering the questions your team used to dig for.

04 You own everything

Every line of code, the infrastructure, the documentation. No vendor lock-in, no licensing fees on your own system.

Proof, in production

IN PLATFORM VALUE DELIVERED

Enterprise operations platform

A national Australian solar company needed its operation on one platform. We built it: sales, jobs, scheduling, installation, invoicing - one pipeline connecting fifteen SaaS platforms into a single source of truth. The first production deploy landed three weeks after the first commit. Nine months later the platform runs the business - hundreds of sales processed every month, 24/7, hands-free. The same platform now answers to leadership directly: a governed AI workspace where executives ask in plain English and get live dashboards back.

Case studies are anonymised by design. Our clients' operational advantage stays theirs - discretion is part of the service.

Order out of complexity

I'm Ramsay Hatfield, and CoreSentia is my studio. I've spent the last few years inside a national Australian solar company, where I built the operations platform the business now runs on - 320,000+ lines of production TypeScript, fifteen integrated SaaS platforms, hundreds of sales processed every month.

That work taught me where software earns its keep: in the gap between how a business thinks it runs and how it actually runs - where quotes stall, data gets re-keyed, and time quietly disappears. Closing that gap takes working software in production, built by someone who's taken the time to understand the operation.

Every platform I build is developed AI-natively - frontier models wired into the work from the first session to production, governed and logged. It's why one person ships what used to take a team. Most businesses are still deciding whether to take AI seriously. You can hire someone who already has.

Outside of software, I'm a landscape and astrophotographer. Same instinct, different medium - finding the order in complexity.

RAMSAY HATFIELD - FOUNDER.
